Mr. J. Dalton  
Sauget Waste Treatment Plant  
Sauget, Illinois

Subject: Estimated Flow - 6/23 to 7/23/78

Dear Mr. Dalton:

The estimated average daily flow from Cerro for the period of 6/23 to 7/23/78 is 450,000 gallons per day.

The split on this flow is estimated to be 25% through Cerro East and the balance Cerro West.

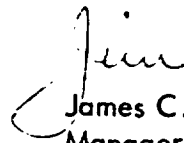

The conditions discovered on 7/12 on the flow in 24" village sewer questions the validity of any samples taken at your 24" metering station.

The quality of the sample from Cerro West should consist of city water, well water and a small flow from administration building and cafeteria. The well water is used to quench hot anodes and could contain some copper oxide. All other operations that normally discharge to Cerro have been shutdown during this period.

If you have any questions, please advise.

Very truly yours,
